

One of the features that contributes to the effectiveness of my plot is the color, which helps visually distinguish between the stores without needing to focus on the legend, which contributes to pre-attentive processing. However, due to the large amount of ultra-processed food sold at all stores, there is heavy overlapping in the colors after the 0.7 FPro Score point. This can either help or muddy the interpretation about Whole Foods actually selling less processed food than the other stores depending on how well the viewer is able to distinguish the green color/layer from the blue and red. This contributes to the idea of selective attention.
